

ANA selects Viasat Amara IFC for international classes on 767-300ER fleet

ANA selects Viasat Amara for IFC

All Nippon Airways ([ANA](#)) is introducing free, high-speed inflight internet service capable of video streaming for all international classes on its 767-300ER (202-seat configuration, JA625A) aircraft.

Powered by the latest system from [Viasat Inc.](#), the advanced service will allow passengers to enjoy smooth, fast connectivity from boarding to disembarkation, providing a ground-like internet experience in the air.

"The integration of Viasat's Wi-Fi equipment enables the 767-300ER aircraft to offer a seamless and stay connected internet experience, mirroring ground-level performance," said Tomoji Ishii, Executive Vice President, Customer Experience of ANA. "ANA is committed to strengthening its inflight connectivity and will continue delivering future improvements to enhance customer convenience."

"As ANA's passengers increasingly value staying connected inflight with high-speed Wi-Fi, especially on international routes, we are honored to support ANA in offering free, streaming inflight internet on Viasat-equipped aircraft," said Mark Dankberg, Chairman & CEO, Viasat, Inc. "ANA has selected our next generation Viasat Amara solution, which combines proven technology and capabilities with a robust innovation roadmap designed to service ANA today and well into the future."

ANA is strategically phasing in the service, aiming to complete modifications on three 767-300ER aircraft by the end of fiscal year (FY) 2025. By FY 2026, the airline plans to extend the high-speed Wi-Fi access across all six 767-300ER aircraft. ANA will also integrate Viasat's system into additional new international aircraft after FY 2026, progressively expanding the free, all-class service across its fleet.

ANA plans to upgrade additional aircraft and aims to provide free high-speed inflight internet for all classes on more than 80 percent of its international fleet by the end of 2030.
