

Linstol introduces NexSeam™ inflight loungewear

Linstol's NexSeam™ inflight loungewear with advanced seam-free weaving technology

[Linstol](#) has introduced NexSeam™, inflight loungewear designed to deliver seamless comfort, thoughtful performance and efficient production.

At the core of NexSeam™ is advanced seam-free weaving technology, eliminating traditional stitching to create a smooth, continuous garment. This innovation enhances durability and fit while removing friction points, Linstol said in an April 2 press release. The result is comfort at altitude, allowing passengers to relax, rest and move freely without restriction.

Designed with wellbeing and greater sustainability in mind, NexSeam™ is inherently skin-friendly, minimizing irritation and providing a soft, breathable feel suited for long-haul travel. Every detail is tailored specifically for the airline environment, ensuring an optimized fit that balances ease of wear with a polished, premium appearance.

Beyond comfort and design, NexSeam™ supports cost-efficient, scalable production. Its streamlined manufacturing process reduces material waste for more sustainable production and lower complexity, enabling airlines to deliver elevated onboard apparel.
