

# HOBART flight-type dishwasher named Solution of the Year

HOBART's flight-type FTPi dishwasher has been named Solution of the Year

Warewashing technology manufacturer [HOBART](#) has announced today that its flight-type dishwasher FTPi has been named Solution of the Year for the warewashing category by [Callwey Verlag](#) publishers.

The "climate-plus" energy saving system uses a combination of drain heat recovery and modern heat pump technology to return 70 percent of waste water energy and 100 percent of exhaust air energy to the wash cycle. In traditional systems, this valuable energy is typically left unused. This method reduces energy consumption and operating costs while ensuring a constant exhaust air temperature of 17°C. The hot waste water is passed through a heat exchanger unit, where the incoming fresh supply water is heated by the waste water using the counter-flow principle. At the same time, the energy from the hot exhaust air is also fed back into the wash cycle.

## The competition

The prize was awarded as part of the *Finest Restaurants & Bars* competition. It was judged by a jury of hospitality planning experts and interior designers. The competition honors the most innovative product solutions with respect to professional hospitality design and highly functional hospitality technology. Callwey Verlag looks for the Solution of the Year across many product categories, recognizing companies in the hospitality sector whose products make an important contribution to German restaurant culture.
